The ever-growing digital era has an impact on the way we interact with consumers. Lesehan ABCD is one of the food stalls that serves food with distinctive flavors and a comfortable atmosphere for customers. Lesehan ABCD serves food orders on the spot, ordering food via chat and by phone. Recording orders that are still manual and recording income and expenses that are still manual makes the bookkeeping of Lesehan ABCD irregular. This research aims to create a website-based online ordering sales application for Lesehan ABCD. The design of the Lesehan ABCD website uses the SDLC (System Development Life Cycle) method with the Agile model which consists of planning, design, development, testing, deploy, review and launching stages. This website was built using the Python language and the MongoDB database. The testing process uses the black box testing method to ensure that each part runs well. The test results show that the system can run optimally, facilitate online food ordering and help business owners in a neater and more systematic financial management. The website can be accessed through the site <https://lesehan-abcd.anitech.id/>. This website helps business owners to promote products online with a wide range and allows customers to continue to enjoy food without having to come directly to the restaurant.
