DEPOK CITY PUBLIC LIBRARY

Thesis. Department of Architectural Engineering. Faculty of Civil Engineering & Planning. Gunadarma University. 2022

(xviii + 158 + Appendix)

Depok is a city located in the south of Jakarta which acts as a satellite city of the capital. Along with the development of the capital, the city of Depok was also affected by this development. The development of Depok City is quite significant in recent years because it launched the Depok Smart City Flagship Program and its strategic location and became the border between the provinces of West Java, DKI Jakarta, and Banten.

In order to support the government program, a Public Library is needed that can improve the culture of community literacy through efforts to improve the community's quality of life with an environment that is friendly to every age and group and supported by renewable technology (smart building).

In this design report, the type of library that will be implemented is a public library in the Depok City Area, so this regional library is the ownership library of Depok City. The functions of this regional library include a place to preserve regional library materials, a medium to create and increase the reading interest of regional children, a place to read comfortable books, an educational function, and a place for lifelong learning. In addition to education and reading, this regional library can also be a place of recreation or relieve the boredom of residents, as well as a place of cultural introduction through books, a place for socialization of residents, and a place for children to play.
