The planning of building section drawings and staircase design is a crucial phase in the construction of a building that involves collaboration between architects and consultants as design experts. Consultants play a crucial role in elaborating the building design plans into detailed section drawings, ensuring the safety and functionality of the staircase structure, and efficiently planning the use of space beneath the staircase as a functional area. A case study on the Dr. Muhammad Masrin Boarding House Project highlights the collaboration of the author with CV. Asri Rekatama Sejahtera in planning building sections, stairs, and the space beneath the staircase, including participation in discussions with the lead architect, junior architects, and planning managers. The outcomes will be incorporated into the project's final report.
