Keywords: Website, Consultation, Maintenance

(xv+85+Lampiran)

Kiky Clinic is a beauty clinic for facial skin care specifically for women, located in Bogor. Until now, Kiky Clinic still carries out manual processing and consultations. Apart from being inefficient, manual systems require a lot of time and good storage. To overcome this problem, a website-based online processing and consultation application was created. The website created aims to make it easier for admins to manage data, consult, and make it easier for customers to view Kiky Clinic information. This application uses the System Development Life Cycle (SDLC) method which has stages of needs analysis, design, implementation and testing.

This website has been tested using the BlackBox method, namely by testing the features on the website as designed. All features have admin access rights and customer access rights. All features can run well. This website can be used by Kiky Clinic admins and customers.
