Gaming top-up is the activity of recharging or adding game vouchers in the game so that you can make transactions. Most gaming top-up websites have many obstacles such as appearance, price, and less diverse types of games. The solution obtained is to create a Website-Based Queen Store Gaming Top-up System that can make it easier for the general public to top-up games by including a number of features, including orders, payments, checking transaction history and chat bots. In its implementation, the author uses PHP and MySQL programming languages as database servers. This Website-Based Queen Store Gaming Top-up System has been successfully created and tested using the Black Box Testing method by the author in accordance with the expected goals. This system is used to make game top-up transactions where using Midtrans as a payment gateway so that payment transactions can run safely. The Website-Based Queen Store Gaming Top-up System can be accessed through <http://percobaan-topup.epizy.com/>.
