Since its establishment, Ruang Jiwa has been committed to providing an easily accessible mental health platform for the community. Previously, mental health services were conducted manually, which often led to difficulties in managing user data and delivering timely services. This research aims to develop a web-based mental health management system that allows users to access mental health information online. The system was developed using PHP and MySQL, accessible via the URL <http://ruangjiwa.my.id/>. Testing results using the Black Box method indicate that the system functions well, meets user needs, and provides easier access to mental health resources. The implementation of the web-based mental health management system at Ruang Jiwa has successfully improved service delivery efficiency, provided better support for users, and facilitated more accurate decision-making in maintaining their mental health.
