Warung Src Jonathan is a store that sells staple, food and beverage products. This website was created to facilitate the sales process. This application has two pages, namely a page for customers and a page for admin. On the customer page, customers can view available products and make purchases. As for the admin page, the admin can perform operations to add products, change products, delete products, view buyer payments, update buyer status and view purchase reports. The stage in making the application for the first time was a field study, where at this stage data collection was carried out from sources by interviewing the owner of Warung Src Jonathan so that the website created was in accordance with the needs of the shop. The second stage in this manufacture uses the Rapid Application Development (RAD) stage. Testing using the black box method shows that the Warung Src Jonathan application functions as expected. Testing on laptop and smartphone devices by running a website on one laptop and two smartphone devices on one smartphone such as the Vivo Y12 can run well and the Iphone XR can also run well. The Warung Src Jonathan website can be accessed via the URL <http://srcjonathan.my.id/>.
