Accounting Information System is a collection of resources designed to transform financial data and other data into information. The resulting information will be used in various forms for decision-making purposes. Accounting information systems play an important role in providing information for companies, improving existing information systems, both in terms of quality, accuracy of presentation, and information structure.

The purpose of this research is to find out and provide suggestions for accounting information system at UMKM Ibu Laundry according to the information needs of stakeholders. The data used in this research is primary data. The analysis technique used in this research is descriptive qualitative analysis by conducting system analysis and making conceptual design by designing document flowchart, context diagram, Data Flow Diagram (DFD), Entity Relationship Diagram (ERD), normalization and database design.

The results showed that the cash sales system at UMKM Ibu Laundry has problems in the sales payment system which are still done manually using simple documents that have the potential to cause problems in the accuracy, completeness, verification, and recording of sales data. This has an impact on the quality of the resulting information which is less valid and less suitable for use as a consideration in decision making. It is better for companies to use a computerized system for company security and data accuracy, as well as using complete documents for sales activities.
