Anxiety is one form of individual emotion that is characterized by symptoms of physical tension and feelings of anxiety when facing several things that are considered as a threat, obstacle, and an event that will come. This study aims to examine whether there is a relationship between social support and anxiety in facing the world of work for final year students. The sample in this study were 150 final year students. The research method used in this study uses a quantitative method using SPSS 22 for Windows and the hypothesis test is carried out by Pearson product moment parametric statistics. The results of this study show that there is a very significant negative relationship between social support and anxiety with a correlation coefficient of $r = -0.448$ with a significance value of 0.000 ($p < 0.01$). For students, it is expected that they can manage the social support that has been given to make the spirit meet the future. Existing anxiety can be transformed into a measure of yourself to what extent it has developed. A little anxiety shows that students have the desire to try their best.
